

Create a webpage that displays a gallery of images, given a JSON array containing a list of image URLs.

Here are the requirements:

- Do not use any Javascript libraries or frameworks for your webpage. Javascript build tools are ok.
- ES5 or above is preferred.
- The basic layout should be a grid of pictures.
- The images should be reorder-able by dragging and dropping. Dragging an image to a new position should insert that image at the new position, and maintain order of other images. It should **not** swap images.
- Any other functionality is not expected.
- The submitted code should be runnable and viewable. Add any instructions necessary to a README.md file.

You are provided with a directory of sample pictures for convenience.
